

FLUOR Instrumentation

by
Benjamin Mollier

Short description of FLUOR

- FLUOR is a singlemode fibers recombiners
- Works in K-band ($2 - 2.4 \mu\text{m}$)
- Singlemode fibers :
 - Pupil phase corrugations
 - intensity fluctuations
 - Easier calibration
 - Piston not filtered
- 4 outputs
 - 2 photometric channels
 - 2 interferometric channels

Temporal relevance of FLUOR

- Complementarity FLUOR and other CHARA instruments
- What is the niche of FLUOR ?

	Visible	near-IR	mid-IR
Imagery	NPOI	VLT/Amber CHARA/MIRC MROI VLT/Gravity	
High-Dynamic	CHARA/VEGA	CHARA/FLUOR	VLT/MIDI LBT/Nuller Kech-I/Nuller

+ Maturity, accessibility, long baseline, data simplicity

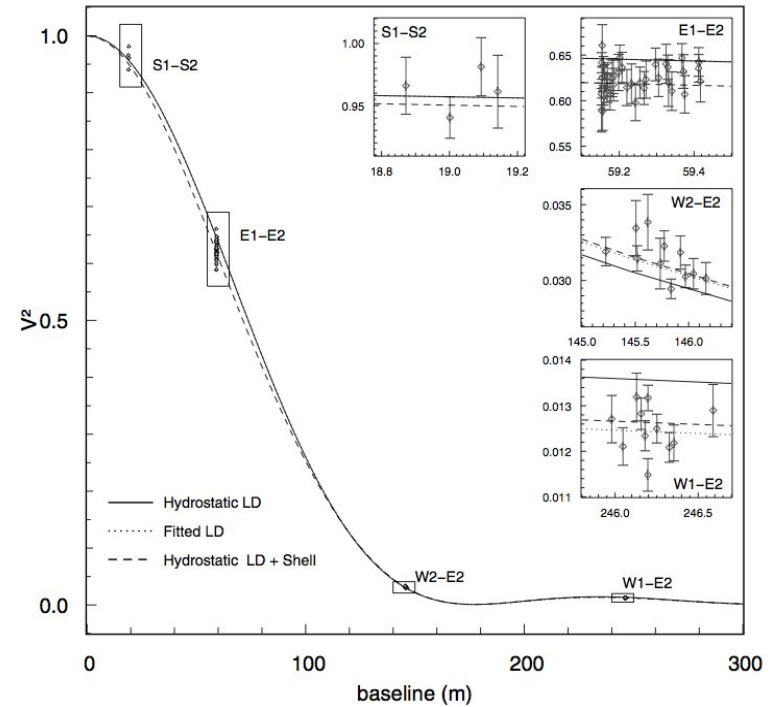

Why JOUFLU ?

(Rejuvenation and upgrading of FLUOR)

- FLUOR has not changed since IOTA
- We must adapt FLUOR to the environment
CHARA
 - Being able to follow evolution of CHARA
 - Being able to connect to other subsystem (VEGA, CHAMP)
- Remote observing on a routine basis

Increase dynamic

- Current dynamic is around 300
- Dynamic is limited by some bias :
 - Piston
 - Chromatic bias
 - Number of scans
 - ...
- Solutions :
 - Fringe tracking
 - Spectral dispersion
 - Faster observation sequences

Mérand et al. 2006, A&A 453, 155

Spectral resolution

- Implement spectral resolution : 2 options
 - Prism
 - Double Fourier mode
- What it implies ?
 - Greater coherence length → change fast scan
 - Need phase stability → CHAMP connection

FT from CHAMP

- We need to stabilize fringes
 - Long exposure
 - Reduce phase error
 - No piston for double fourier interferometry
- Increase spatial and spectral resolution
- Idea : Use CHAMP
 - Is it possible that CHAMP work with only 2 telescopes ?

Remote mode, automatisisation

- Automatisisation of ALIU (Alignment procedure)

2 goals :

- Limit number of intervention in the lab.
- Implement remote mode

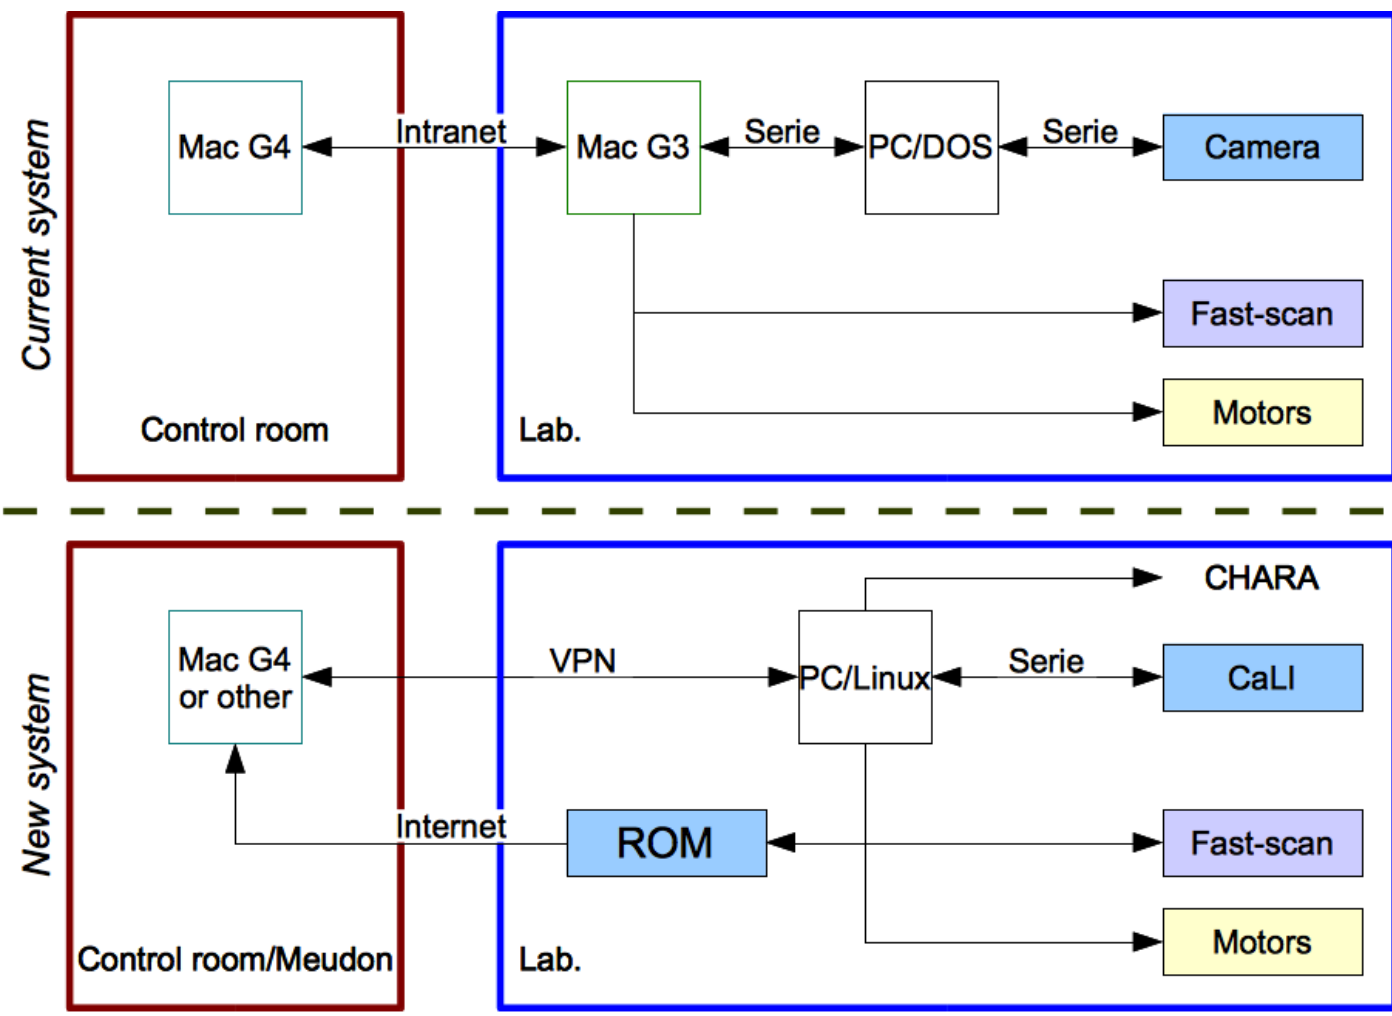

Pupil from VEGA

- New in ALIU : Alignment of pupils
- Why ? CHARA's pupil move during the night
→ Flux can fall suddenly
- Problem : FLUOR cannot image the pupil
- Idea : Use pupil location system of VEGA

New control system

Take home message

- Increase dynamic from 300 to higher as possible
 - Spectral resolution
 - Fringe tracking (CHAMP)
- Connect with VEGA
 - Imaging pupil
 - Simultaneous multicolor observations with VEGA
- Automatisation of alignment procedure
 - Remote mode
- New control system
 - Follow evolution of CHARA
 - Connect to CHAMP, VEGA...
