VLTI Update *and* A Proposal for Optical ‘Self-Cal’

Gerard T. van Belle
PRIMA Instrument Scientist
European Southern Observatory
March 9th, 2010

A Humble Competitor to Mt. Wilson

VLTI status

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- Mature instruments
 - AMBER/MIDI
 - FINITO
- VLTI Developments
 - AT Upgrades
 - Instrumentation
 - ❖ PRIMA
 - ❖ GRAVITY
 - ❖ MATISSE
 - ❖ PIONIER
 - Infrastructure studies
 - ❖ 2GFT (4× fringe tracking)
 - ❖ NAOMI (adaptive optics)
 - ❖ MAMMUT (pathlength control)

VLTI status: New Instruments

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- PRIMA
 - Dual-beam 2×AT, UT observing
- GRAVITY
 - Dual-beam 4×UT 10 μ s faint ($m_K < 19$) astrometry
 - Probe strong gravity regime by observing galactic center
- MATISSE
 - 4×AT, UT L,M,N-band imaging
- PIONIER
 - Visitor instrument
 - 4×AT, UT K-band imaging

European Organization for Astronomical Research in the Southern Hemisphere

VLTI PRIMA Project

PRIMA: The Dual-Feed Facility for VLTI

- PRIMA = Phase Referenced Imaging and Microarcsecond Astrometry
- “Two interferometers in one” tied together by laser metrology
- An instrument or a facility?
 - A bit of both
- Enables 3 new modes:
 - Stand-alone instrument: **Astrometry**
 - Facility feeding AMBER/MIDI:
 - ❖ Faint star science (like single-aperture NGS)
 - ❖ Phase-referenced imaging

09.03.2010

PRIMA Modes Details

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLT PRIMA
Project

➤ Astrometry

- Primary star: science target, bright ($K < 8$), possibly has planet, used to phase instrument
- Secondary star: dim ($\Delta K < 5$), background, astrometrically stable (as verified by RV if necessary)
- Δ OPD between two interferometers → astrometric separation vector → science at the $\sim 30 \mu\text{as}$ level

➤ Faint object science

- Primary star: bright ($K < 8$), boring, used to phase instrument
- Secondary star (or ? see image above): science target, dim ($\Delta K < 5$), fed into AMBER/MIDI
- V^2 measurements of AMBER/MIDI → science

➤ Phase referenced imaging

- Like faint star science operationally, with addition of PRIMET metrology
- V^2 , $\Delta\phi$ measurements of AMBER/MIDI → science

NTT SOFI Image
of galaxy ESO 548-81

Faint-Object Mode Example

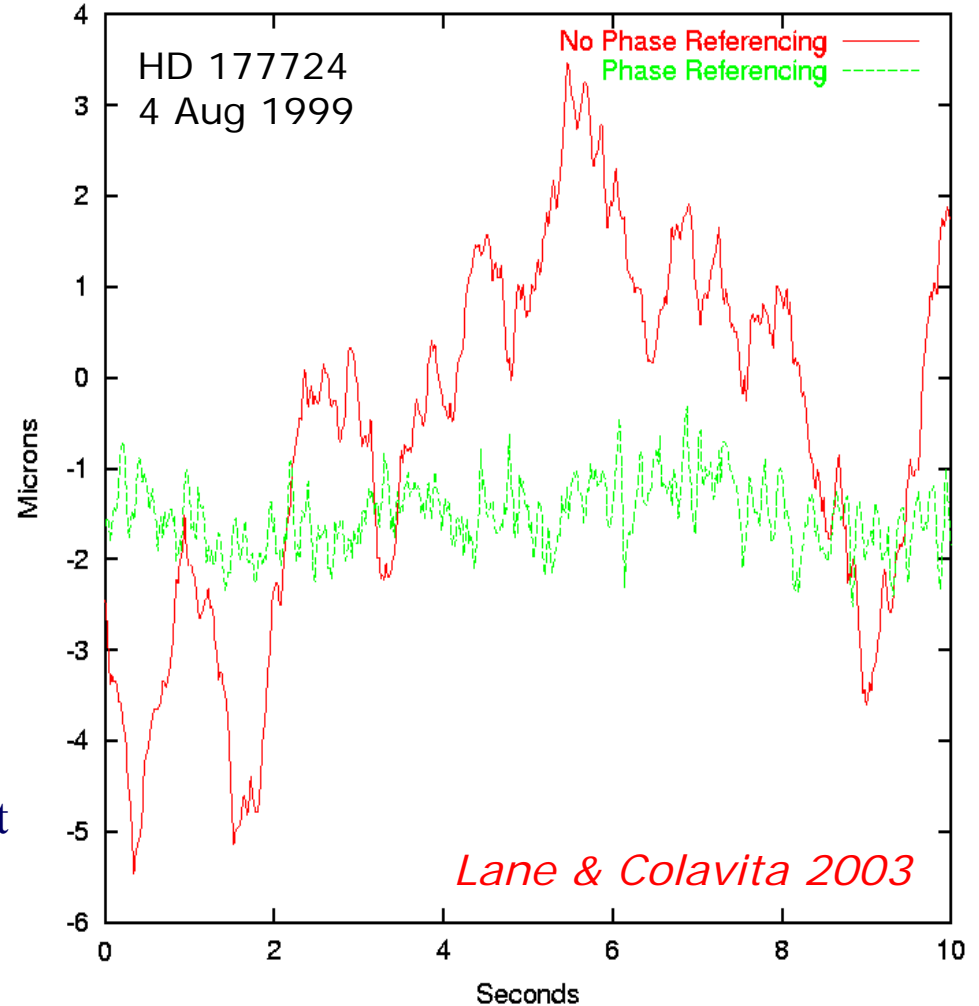

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- Objective: long synthetic coherence time for faint-object detection – fundamentally enabled by dual-beam optical design
- The analog of single-aperture AO
 - Fringe tracking piston correction signal on one object is used to correct the piston on a second, nearby (isoplanatic separation) object
 - Required for VLTI (and KI) faint-object interferometry
 - Phase error with and without loop closed between the two PTI fringe trackers
 - Two data segments taken within 200 s of each other

Hemisphere

VLTI PRIMA
Project

www.xkcd.com

- All the possible science sounds *great*
- When's it going to be ready?
 - See cartoon above
- Let's take a step back and see *how* it's being done

PRIMA Architecture

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLT PRIMA
Project

- Auxiliary Telescopes (ATs)
 - Collects starlight
- Star Separators (STs)
 - Picks out two sources in a 120" FOV
 - Tip-tilt field stabilization (STRAP)
 - Metrology endpoint
- Main Delay Lines
 - Provide optical path delay to both starlight beams
- Differential Delay Lines (DDLs)
 - Provide optical path delay to individual starlight beams
- Fringe Sensor Units (FSUs)
 - Twin fringe trackers for starlight
- PRIMA Metrology (PRIMET)
 - Ties two starlight beam paths together
- Infrared Image Stabilizer (IRIS)
 - Tracks residual tip-tilt errors in lab
- MARCEL
 - Calibration source

PACMAN, ADRS,
dOPDC

PRIMA Commissioning: Sub-System Testing during 2009

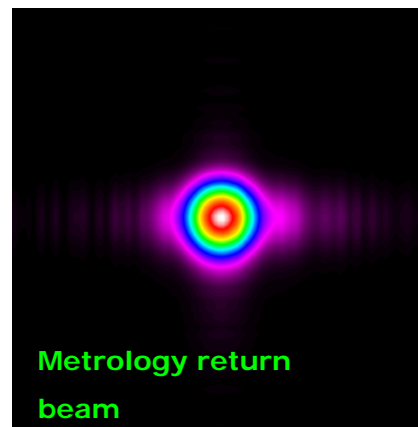

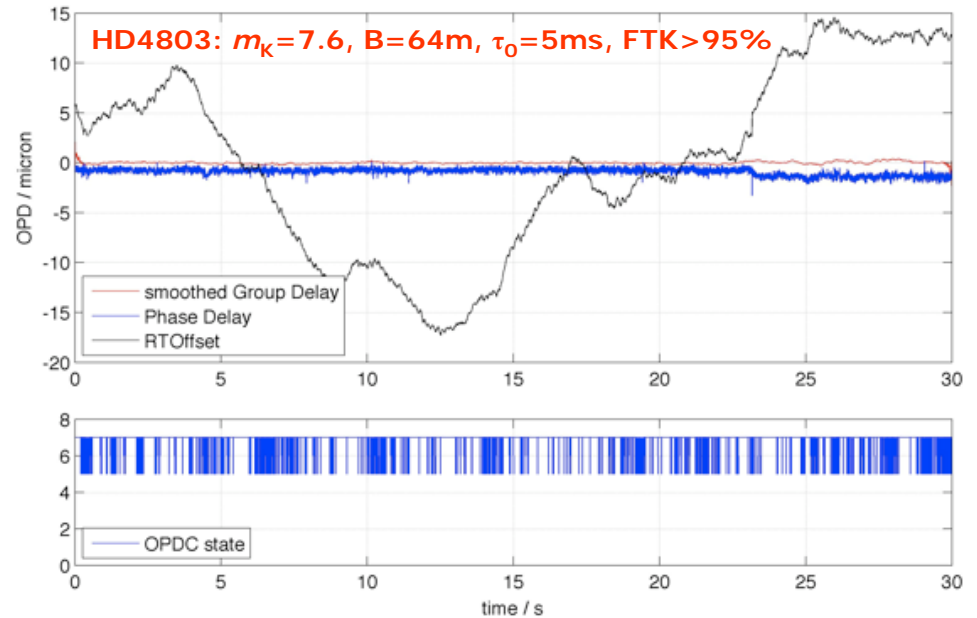

European Organization for Astronomical Research in the Southern Hemisphere

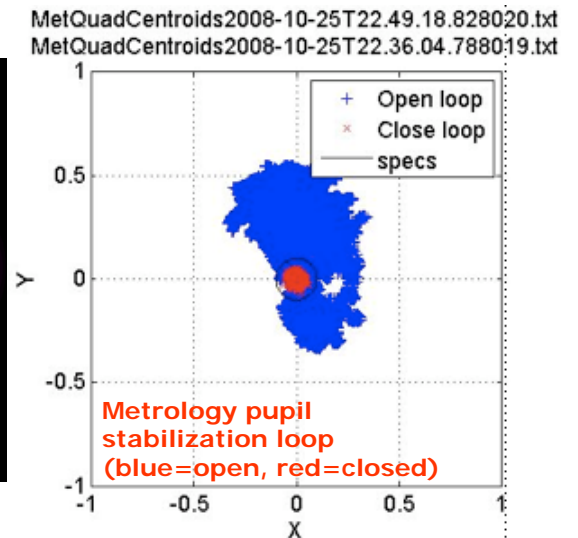

VLTI PRIMA Project

- FSU demonstrated good performance
 - $m_K \approx 8$ expected for reasonable conditions
- PRIMA metrology operating out from VLTI lab to ATs & back
- Additional subsystems functional and/or maturing rapidly
 - Differential delay lines, ISS software, star separators, astrometric software

Gerard van Belle

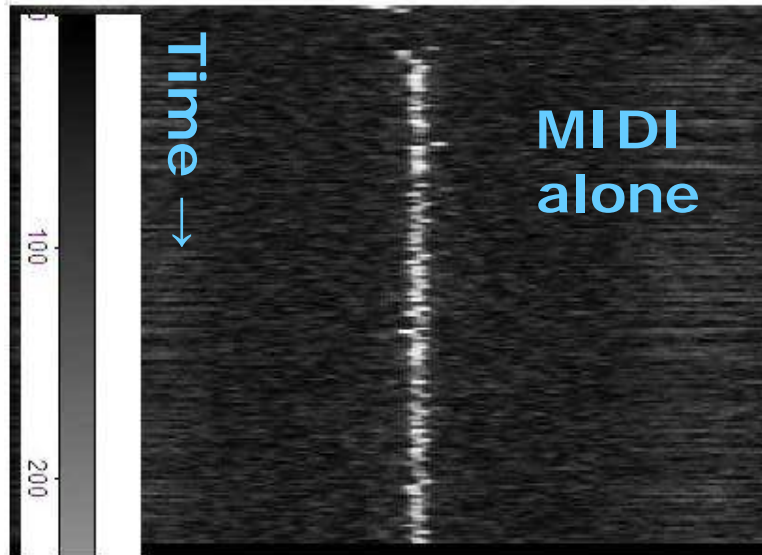

PRIMA Commissioning: FSUA+MIDI Fringe Tracking Tests

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- **Engineering test** of PRIMA+MIDI
 - MIDI can provide fringe tracking (FTK) for itself
 - Same function can also be provided by PRIMA
 - Tests carried out in July, Sept 2009 commissioning runs
 - **Caveat emptor: Non-standard mode**
- Promising results
 - FTK errors (group delay residuals) are an order of magnitude less with PRIMA FTK
 - Also, fringes detected for targets too faint for MIDI FTK ($F_{12} \approx 1\text{Jy}$)
 - ❖ Well below the AT limit of 20Jy
 - Calibration **unclear**, though, due to open photometry questions – work in progress on that front
- Future work
 - Follow-up tests with PRIMA+MIDI, PRIMA+AMBER in dual-feed

PRIMA Commissioning: Dual Beam tests in Dec 2009, Feb 2010

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLT PRIMA
Project

- PRIMA's unique strength will be through simultaneous interferometry of 2 stars at once
- Four starlight beams (2×2 stars) stabilized in tip-tilt for the 1st time in VLT lab in Paranal in Dec 2009
 - Further testing in Feb 2010
 - Dual-star astrometry then follows with 2×FTK+metrology
- Development of this functionality into a fully operational capability the major goal of P85 commissioning work
 - Many sub-system punchlist items remain, along with system integration challenges
 - First PRIMA astrometry to be demonstrated in P85

Dec 2009, Feb 2010:
Light in lab from
2 stars, 2 telescopes

09.03.2010

Gera

PRIMA Commissioning Plans: P85, P86

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- Next commissioning runs:
July, September 2010
 - Heavy science subscription prior to July
 - Dual-star FTK demonstration → astrometric separation vectors
- Period 86 (Oct 2010-Mar 2011)
 - Astrometric commissioning runs
 - ❖ Minimum of 4×10^d
 - PRIMA + MIDI, AMBER-2T commissioning, SV?
 - ❖ Two short runs should suffice for faint object mode commissioning

Johannes Sahlmann (Geneva Obs.) does the PRIMA AIV circus act: trapeze not included

Additional Future Plans

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- PIONIER: next 12 months
- Infrastructure
 - AT Upgrade: next 12 months
 - NAOMI, etc.: next 2-3 years
- MATISSE, GRAVITY:
~2013-2014

VLT PRIMA
Project

Optical Interferometry ‘Self-Cal’

Simple Starting Point

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- Example: Uniform Disk Star
 - Angular size = 2mas
- ‘True’ signal of V^2
 - Decreases with increasing baseline
 - Rate of decrease is connected to wavelength of operation

Imperfect Observation: Atmosphere, Instrument

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- Measured signal is less than unit visibility for point sources
 - Drives the need for **cal-sci-cal** observation cycle to re-normalize data
 - ❖ Additional requirement for point sources, too
 - See the discussion in van Belle & van Belle (2005)
- Furthermore, can be time-variable
 - Changes in seeing, instrument parameters
 - Weakens the validity of **cal-sci-cal** renormalization, particularly for low cadence rates

Consider $V_{\lambda_1}^2/V_{\lambda_2}^2$ Ratios

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- At a given baseline, $V_{\lambda_1}^2/V_{\lambda_2}^2$ ratio is uniquely linked to angular size
- *Important: Ratio is independent of normalization*
- Single **sci** measurement, spectrally dispersed, can provide ratios, without corresponding **cal** observation

Example Case: HIP113715

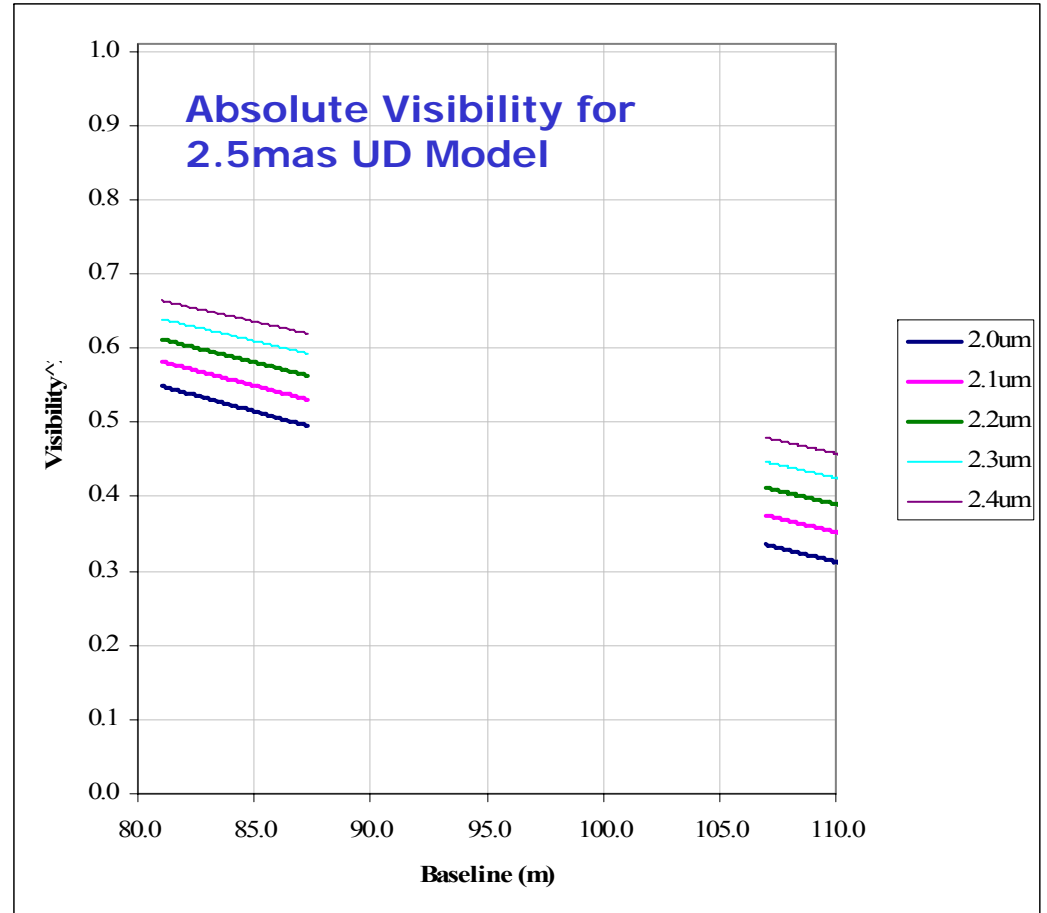

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- PTI observations
 - 85m, 109m baselines both used
 - Multiple nights
- 5 'narrow-band' channels across K-band
- Carbon Star
 - Deviates from UD assumption strongly, particularly at band edges

Example Case: HIP113715

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- PTI observations
 - 85m, 109m baselines both used
 - Multiple nights
- 5 'narrow-band' channels across K-band
- Carbon Star
 - Deviates from UD assumption strongly, particularly at band edges

Fit to HIP113715 Data

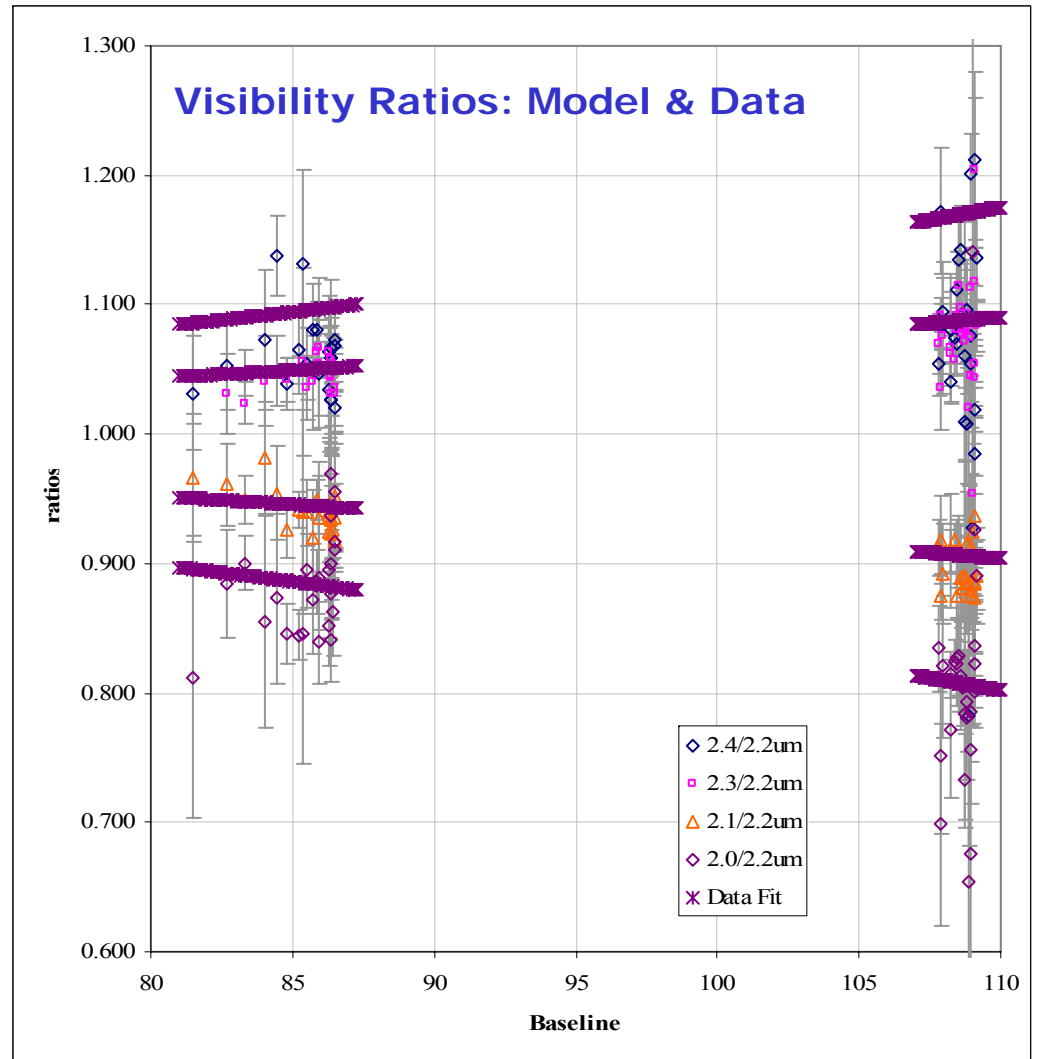

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

- Fit is done for 2.1, 2.3/2.2 μ m ratios
 - Avoids HCN, H₂O, CO bandheads at edges of K-band
 - 2.1-2.3 μ m channels are ‘continuum’
 - Size: 2.446 \pm 0.032 mas
- Existing ‘normal’ **cal-sci-cal** data
 - Size: 2.470 \pm 0.003 mas
 - Errors probably underestimated here
 - Ratios not in ‘sweet spot’ ($V^2 \sim 0.3$ to 0.6)

Something useful here?

European
Organization for
Astronomical
Research in the
Southern
Hemisphere

VLTI PRIMA
Project

➤ Pro

- No cal-sci-cal cycle needed
 - ❖ Greater throughput, no sensitivity to seeing changes
- In fact, no point-like calibrator needed?
 - ❖ Could be quite useful for short- λ instruments

➤ Con

- Is visibility normalization wavelength-dependent?
 - ❖ If so, can this be calibrated? Just once for a night or run?
- Different 'sweet spot' is further down visibility curve
→ lower resolution at a given wavelength
- Uniform disk assumption here is stronger than before
 - ❖ But approach seems to work for a carbon star, so should be OK for 'better behaved' photospheres?
