# Committee and Collaborators

## Advisor

Dr. Russel White

## Committee

Dr. Douglas Gies

Dr. Gary Hastings

Dr. Hal McAlister

Dr. John Monnier (UM)

Dr. Peter Plavchan (NExSci)

Dr. James Sowell (GaTech)

## Collaborators

Dr. Fabien Baron (UM)

Dr. Greg Henry (TSU)

Dr. Gail Schaefer  
(CHARA/GSU)

## Special Thanks

Xiao Che (UM)

Dr. Ming Zhao (JPL)

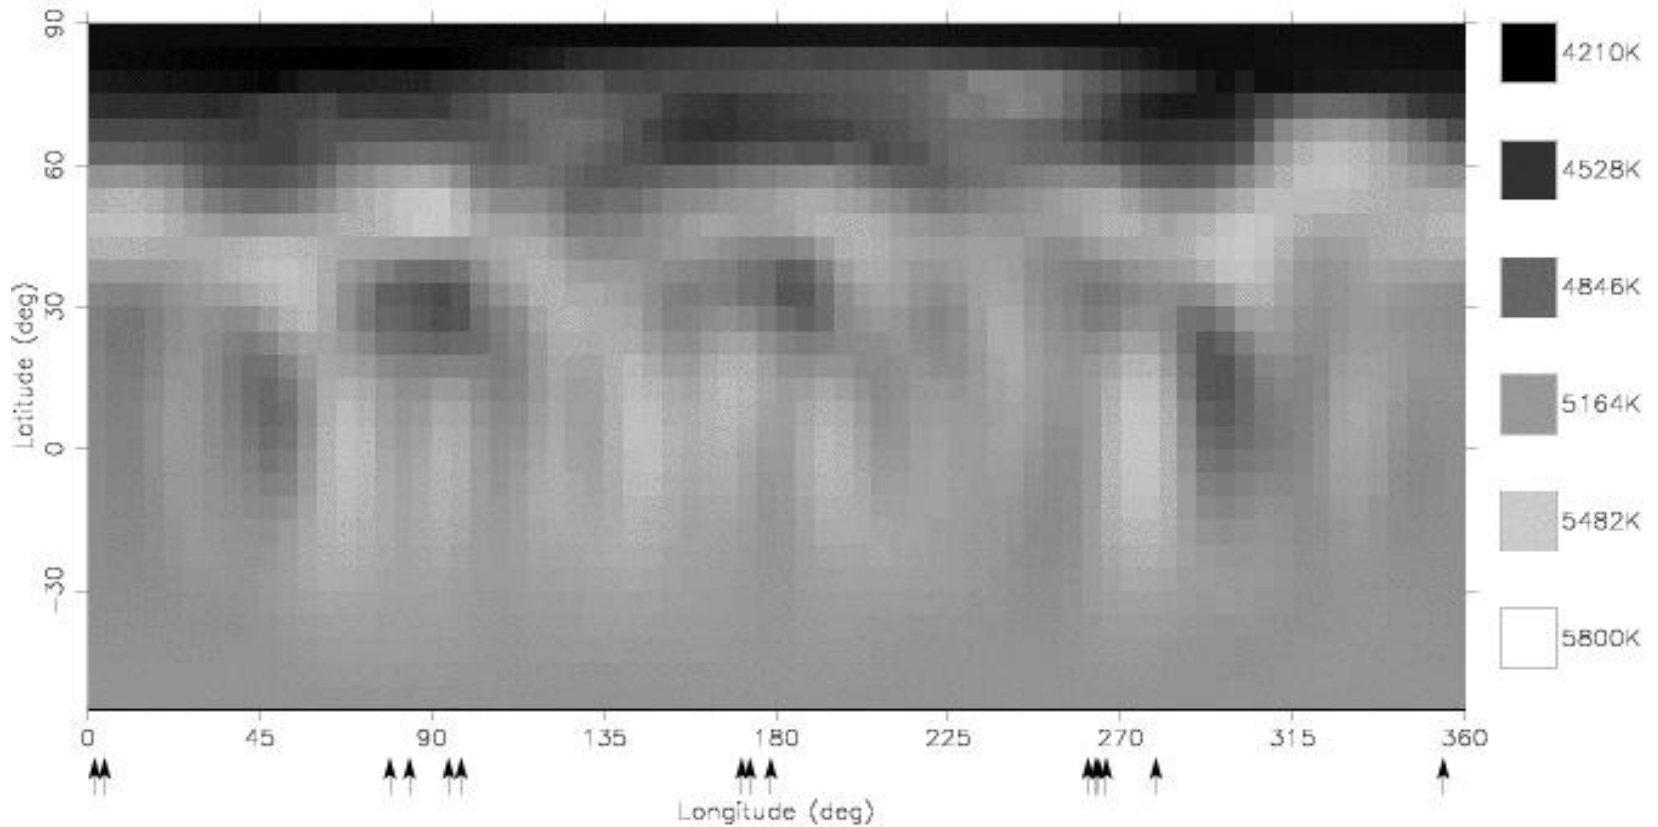

The CHARA team

# Goals Strassmeier et al. 2003

HD 171488 average temperature map

# Goals

Near Solar Max - March 2001

Near Solar Min - January 2005

2001/03/29 09:36 UT

2005/01/07 09:50

# Goals

Strassmeier 1999

# Goals

- Directly image cool starspots
- Precisely measure cool starspot properties
- Observe stellar rotation via cool starspot motion
- Develop techniques for imaging other active stars → compare with Doppler maps

## “Lambdy Andy”

G8 III

SB1

$\pi = 38.74 \pm 0.68$  mas

$D \sim 25$  pc

$v_{\text{ sini }} = 6.5$  km/s

$P_{\text{ phot }} = 54.33$  days

H mag = 1.501

$\Delta V$  mag = 0.22

$\theta \sim 2.75$  mas

# Henry et al. 1995

FIG. 2.—1976–1991  $V$  light curve of  $\lambda$  And from the data sources listed in Table 1. Each point is the mean of (usually) three differential observations in the sense of  $\lambda$  And minus  $\Psi$  And. While the 54 day rotation period is difficult to see at this scale, the changing amplitude of the spot wave and the long-term variations in mean magnitude are readily apparent.

# Lam And Light Curve 2007-2011

# CHARA Observations

- MIRC – H band
- 21 epochs  
– 11/17/07 to 09/10/11
- Various UV coverage
- Mainly use “Schaefer” configuration

Aug 17, 2008

CHARA UV Coverage

Aug 25, 2009

CHARA UV Coverage

# CHARA UV Coverage Aug 24-25, 2010

# Parametric Model & Reconstructions

- Model

- Power-law limb darkening

- 2 stellar parameters

- $\theta, \alpha$

- N spot parameters

- $(\varphi, b, l, f)$  per spot

- Downhill symplex

- MACIM & BSMEM

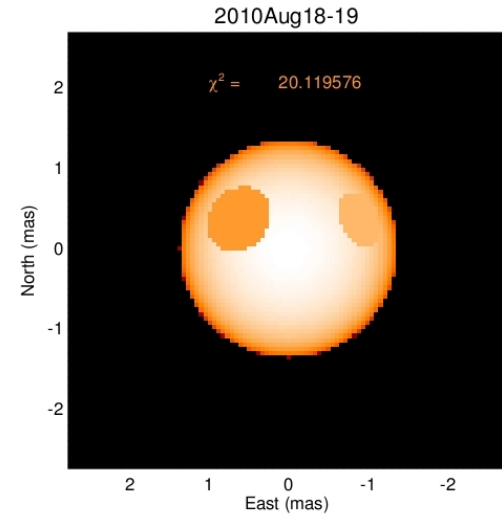

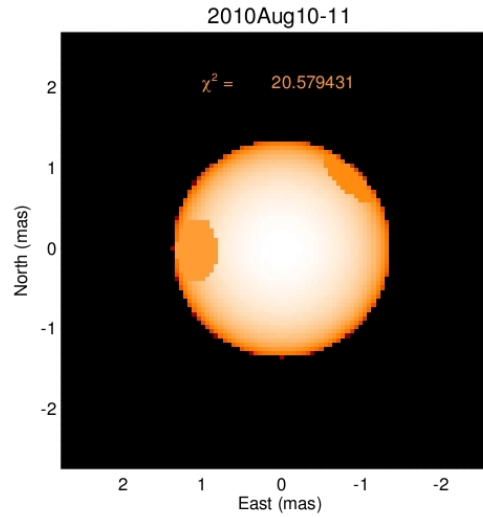

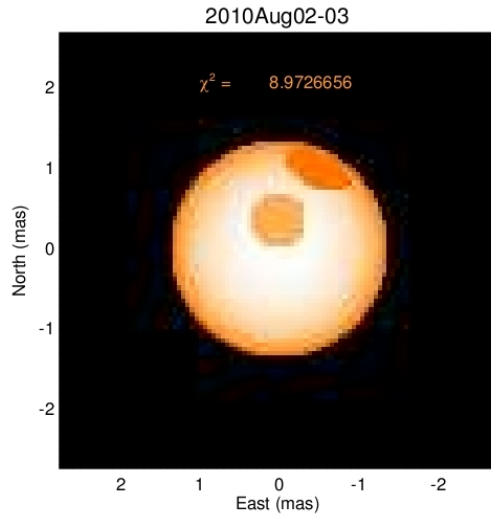

# First Step....

# Consistency!

# Consistency!

2010Sep02-03

2010Sep10

# Rotation?

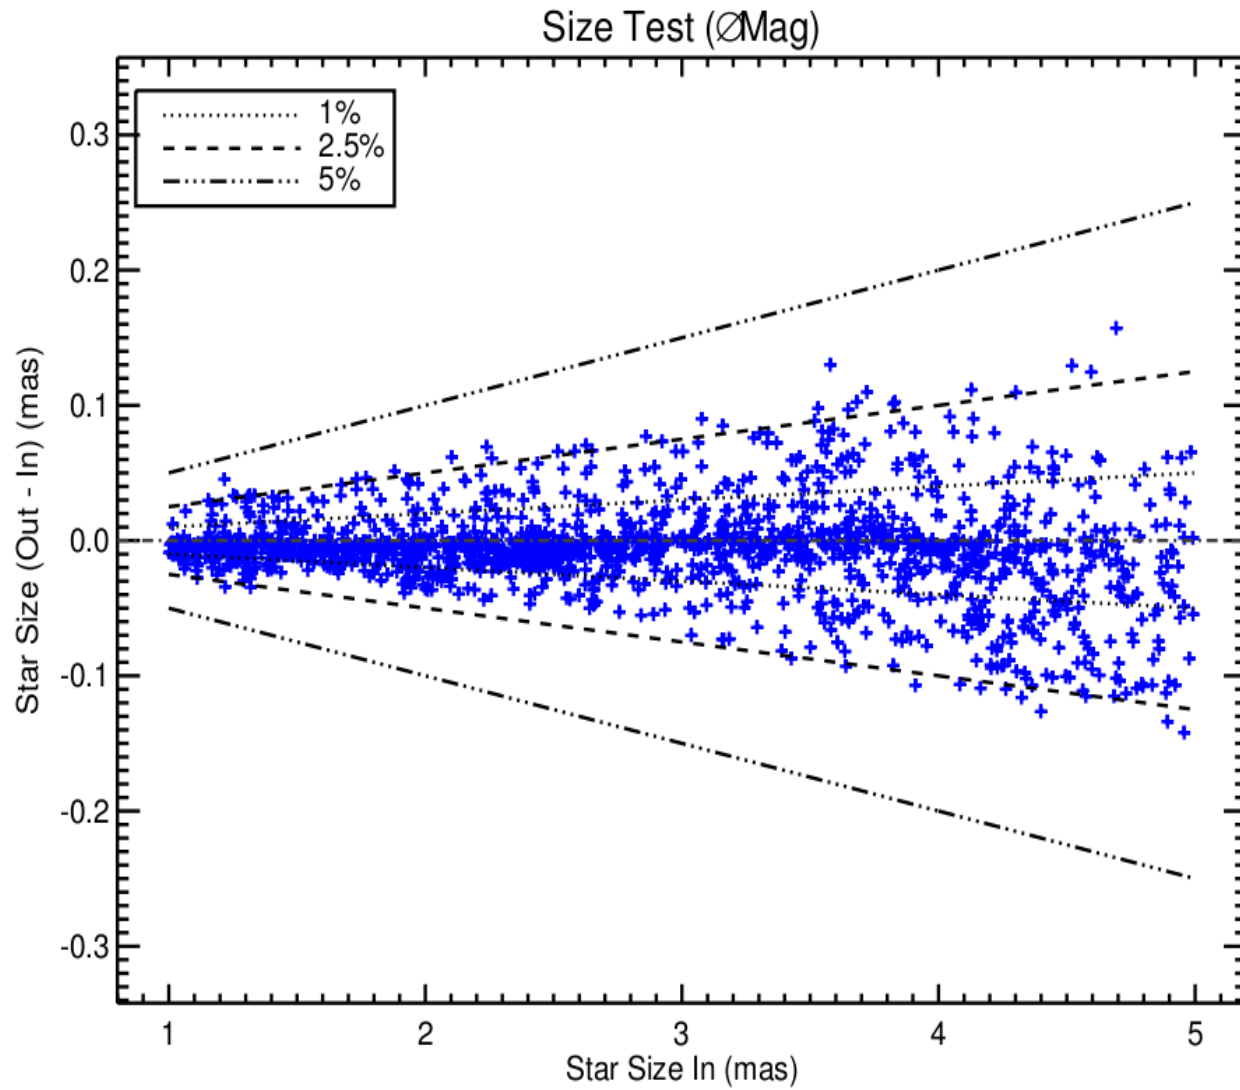

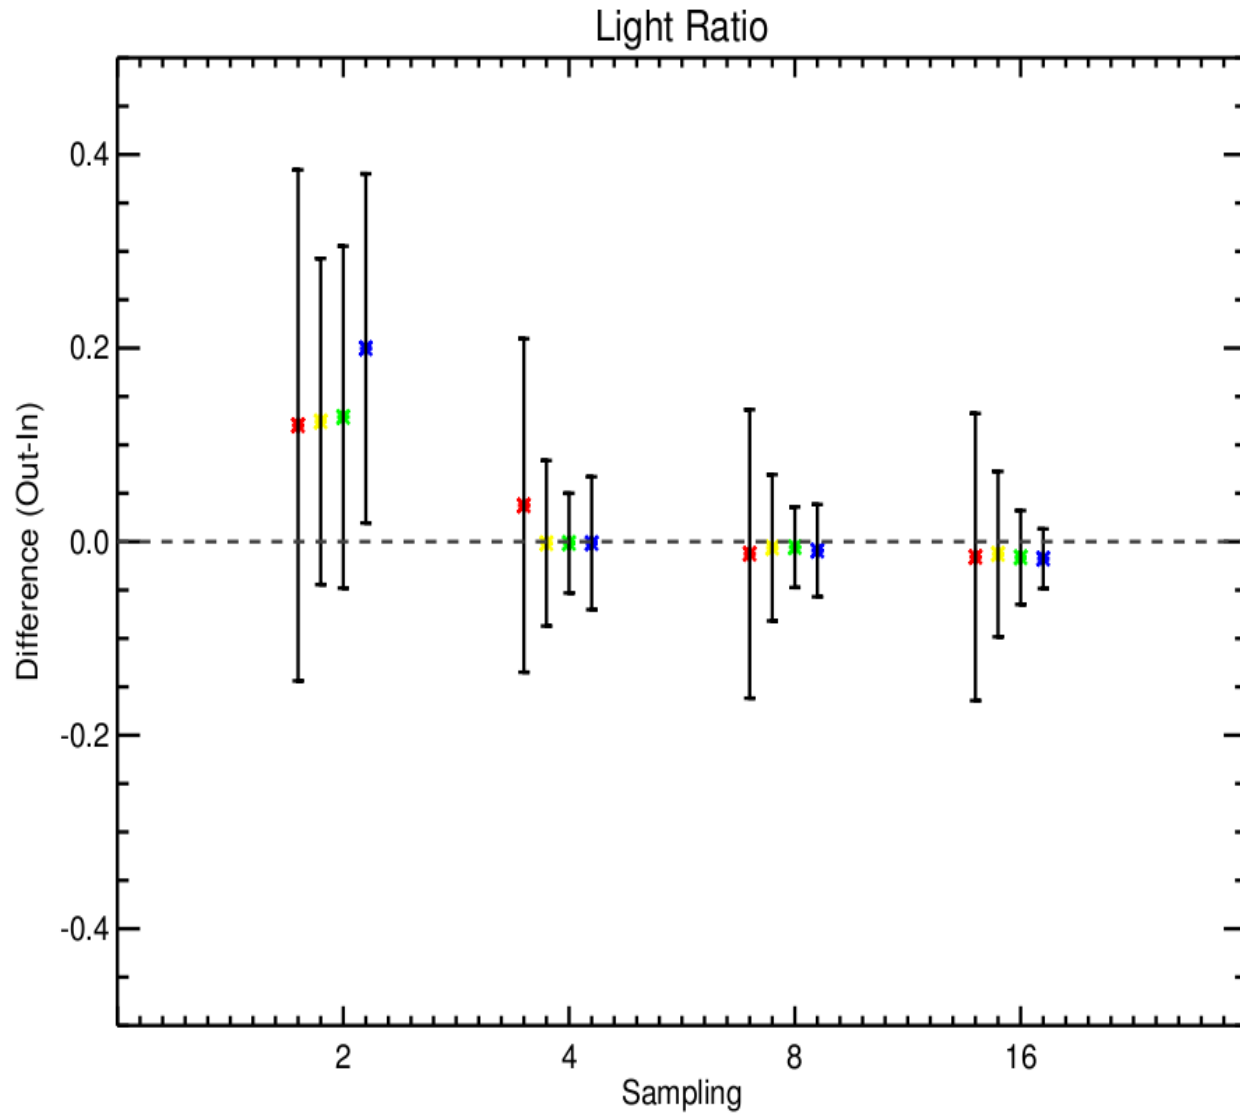

# Can We Believe These Results?

- Monte Carlo simulations
- Size Recovery – 2000
  - Only fit to 1<sup>st</sup> visibility lobe
- Spot Recovery – 500
  - Fixed  $\theta$  &  $\alpha$
- One-spot model

<b>Stellar Size</b>	<b>1 – 5 mas</b> <b>2.75 mas</b>
<b><math>\alpha</math></b>	<b>0.24</b>
<b>Covering Factor</b>	<b>10% - 60%</b>
<b>Latitude</b>	<b>-90° - +90°</b>
<b>Longitude</b>	<b>-90° - +90°</b>
<b>Light Ratio</b>	<b>0.2 - 0.8</b>
<b><math>\Delta</math> Mag Range</b>	<b>~0.0 - 0.25</b>

# $\chi^2$ Question

- Four averaging methods

$$\chi_r^2 = \frac{(\chi_v^2 + \chi_c^2 + \chi_t^2)}{3}$$

## Straight Average

2010Aug10-11

# $\chi^2$ Question

- Four averaging methods

“Squared” Average

$$\chi_r^2 = \frac{\left( (\chi_v^2)^2 + (\chi_c^2)^2 + (\chi_t^2)^2 \right)}{(\chi_v^2 + \chi_c^2 + \chi_t^2)}$$

# $\chi^2$ Question

- Four averaging methods

“Twice-cp” average

$$\chi_r^2 = \frac{\left( (\chi_v^2)^2 + (2\chi_c^2)^2 + (\chi_t^2)^2 \right)}{(\chi_v^2 + 4\chi_c^2 + \chi_t^2)}$$

# $\chi^2$ Question

- Four averaging methods

$$\chi_r^2 = \frac{\left( (\chi_v^2)^2 + (\chi_c^2)^2 + \left(\frac{2}{3} \chi_t^2\right)^2 \right)}{\left( \chi_v^2 + \chi_c^2 + \left(\frac{4}{9}\right) \chi_t^2 \right)}$$

“2/3 T3” Average

# Answer:

# Yes...Probably
