

# Ongoing Reduction of PTI Giant Diameters

*"I'm Not Dead Yet"*

Gerard van Belle  
Lowell Observatory  
March 19, 2013

# Palomar Testbed Interferometer

- 2-way beam combination
  - 3×50cm apertures
  - 110-m, 2×85m baselines
  - 3-way development incomplete
- H-, K-band operation
- Dual-beam astrometry demonstration
- Automated sequenced observations
  - Very good for survey work
- Operated 1996-2008
- $h$ -index=30

# A Tangential Note on $h$ -index

- Number where a citation rank-ordered list of papers has the  $h^{\text{th}}$  paper number still greater than number of citations
- Attempts to quantify – in a single number – your productivity (number of papers) and your impact (number of citations)
  - Unintentionally ranks longevity, too
  - Eminently unfair, inaccurate, *and widely used*
  - It can be gamed
  - Applied to individuals and facilities
- One should be aware of one's  $h$ -index
  - And your Erdős–Bacon number, too (mine is 9)

# The H-R diagram of Astronomers\*

\* Includes associated others. Apologies to Hertzsprung and Russell. <sup>1</sup> Productive but generally invisible.  
NOTE: As in astronomy, the numbers are correct to a factor of a few. Most of the grey points are purely representative.

# PTI's Greatest Hits

*(ranked by citations for first paper of category)*

- Radii &  $T_{\text{EFF}}$  for GKM Giants (van Belle+ 1999)
- Herbig Ae/Be Stars (Eisner+ 2004, 2003, Kraus+ 2008, Eisner+ 2007)
- T Tauri stars (Eisner+ 2005, Akeson+ 2005, Akeson+ 2002, Akeson+ 2002)
- Altair oblateness (van Belle+ 2001, Domiciano de Souza+ 2005)
- Atlas distance (Pan+ 2004)
- M dwarf diameters (Lane+ 2001)
- FU Ori (Malbet+ 1998, Malbet+ 2005)
- Binary orbits: iota Peg, HD195987, 12 Boo, omi Leo, 64 Psc, HD9939 (Boden+ 1999, Torres+ 2002, Boden+ 2000, Hummel+ 2001, Boden+ 1999, 2006, 2005)
- Vega diameter (Ciardi+ 2001)
- Cepheids (Lane+ 2002, Lane+ 2000, Marengo+ 2003)
- PHASES (Lane & Muterspaugh 2004, Muterspaugh 2006, 2008, 2005, 2010)
- Miras (Thompson, Creech-Eakman & van Belle 2002a,b)
- Nova RS Oph, V838 Mon (Monnier+ 2006, Lane+ 2005)
- 51 Peg (Boden+ 1998)
- PTI Calibrators (van Belle+ 2008)

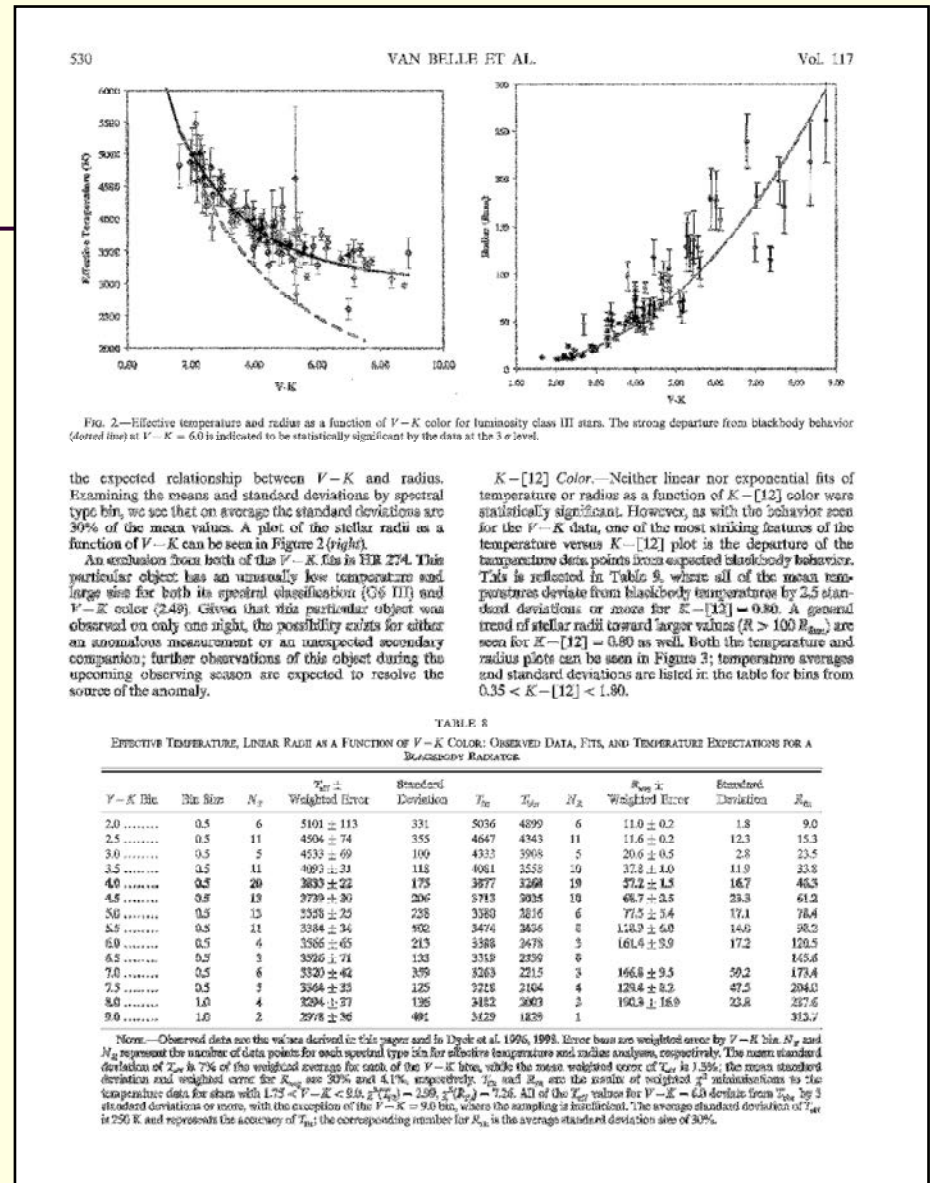

130

20

# Giant Star Survey (original)

- van Belle+ 1999: 59 giants
- Poor  $F_{\text{BOL}}$  data
  - SED fitting was crude
  - $A_V$  correction was poor (at best)
- Old Hipparcos distances

# Giant Star Survey MkII

- Significantly larger sample
  - 240 'normal' giants
    - 9.6 nights each
  - 63 Miras
    - 17 nights each
    - Some up to 97 nights
- Improved SED fitting (see next)
- New Hipparcos distances: 2-3× improvement

SpType	Nstars	Avgnights
G0	1	4.0
G2	1	14.0
G5	3	22.7
G6	1	10.0
G7	6	17.2
G8	27	8.7
G9	9	14.7
K0	17	14.5
K1	12	14.7
K2	22	5.7
K3	19	9.4
K4	19	15.0
K5	30	11.2
K7	2	4.5
M0	9	5.0
M1	11	3.5
M2	13	4.3
M3	13	5.7
M4	8	5.9
M5	4	4.0
M6	6	19.7
M7	1	4.0
M8	5	6.8
M9	1	6.0
SpType	Nstars	Avgnights
M2	1	4.0
M3	6	29.3
M4	14	23.9
M5	18	24.2
M6	13	11.6
M7	4	9.8
M8	3	26.7
M9	3	7.7

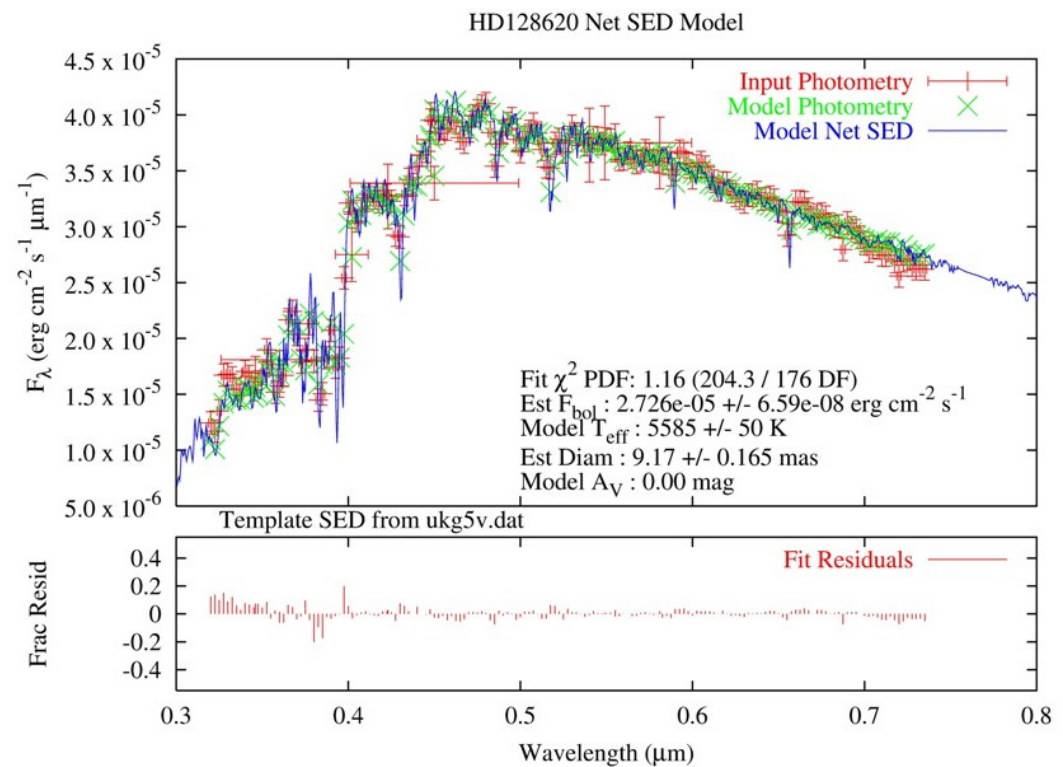

GIANTS

MIRAS

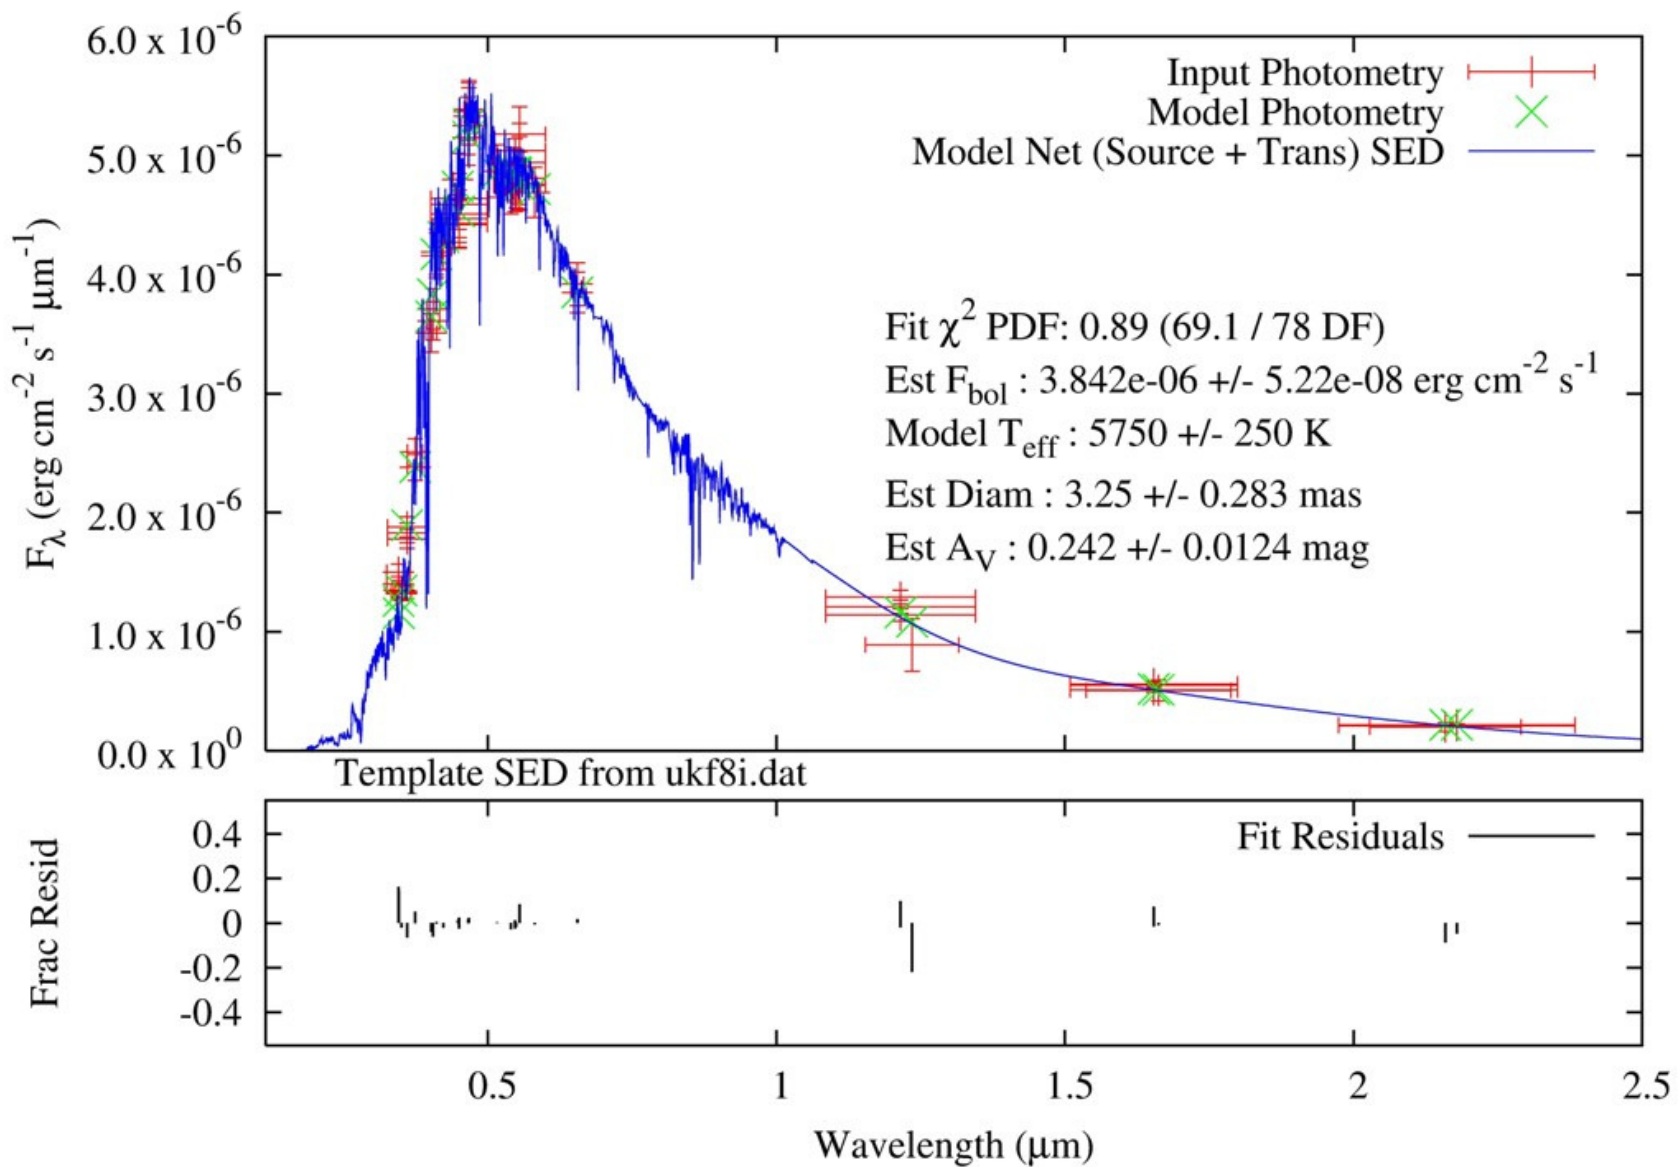

# Improved SED Fitting

- Far richer photometry data sets
  - VizieR, GCPD
- Empirical spectral templates
  - Pickles (1998)
- True reddening fitting
- Spectrophotometry now also available
- $F_{\text{BOL}}$  errors improve from  $\sim 10\%$  to  $\sim 0.5\%$ 
  - Had been limiting term in  $T_{\text{EFF}}$  determinations
- New AndyCode™ - sedFit v2.0 in 'alpha' testing

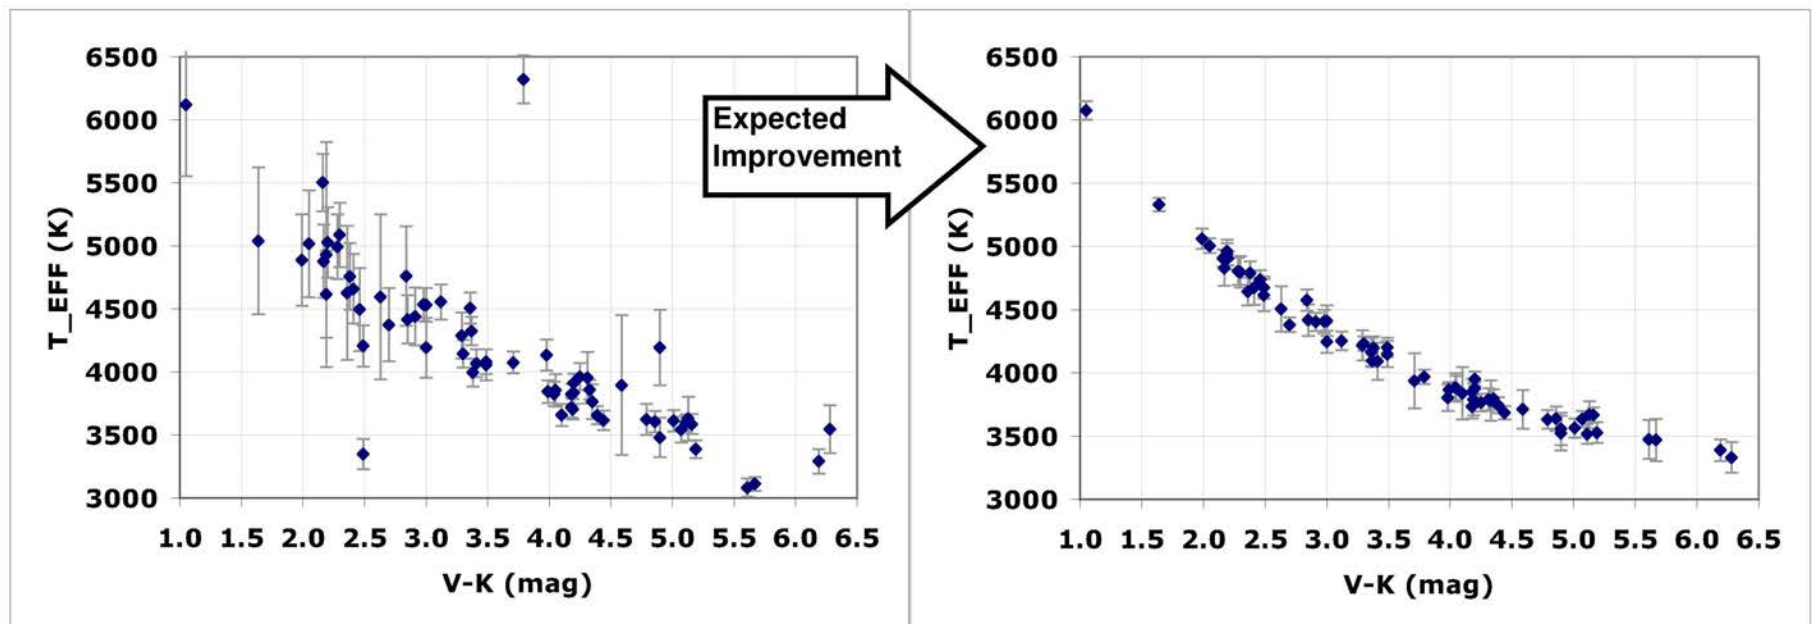

# HD194093 Net SED Model

# Expected Improvement: $T_{\text{EFF}}$

- $\sigma_{T_{\text{EFF}}} \sim 125\text{K}$  should improve to  $\sigma_{T_{\text{EFF}}} \sim 25\text{K}$
- Entirely new realm of precision
  - Can explore 2<sup>nd</sup> order effects – eg. metallicity

# Preliminary Radius Results

- As a function of spectral type and V-K color
- Still need de-reddened V-K results
- Separation of (mis-) classification of luminosity types?
- Highlights the need for better parallaxes
  - Some benefit from Gaia, but bright limit will be a problem

# NPOI Data

- Matching V-band data for this sample
  - Currently ~30 objects with NPOI & PTI data
- Insights on limb darkening
  - eg. Predicted by Davis Tango & Booth (2000), but needs to be measured

# PTI Data Flow

- Level 0 – raw data
- Level 1 – instrument calibrated
  - ← end of night script
  - eg. flat, dark, ratio corrected, 'data editing'
- Level 2 – observationally calibrated
  - ← `wbCalib / nbCalib`
  - normalized  $V^2$ 's
- Level 3 – model applied
  - ← `fitSingle`
  - eg. uniform disk fit
    - ← wrapper scripts

[Data Flow Demonstration Here]

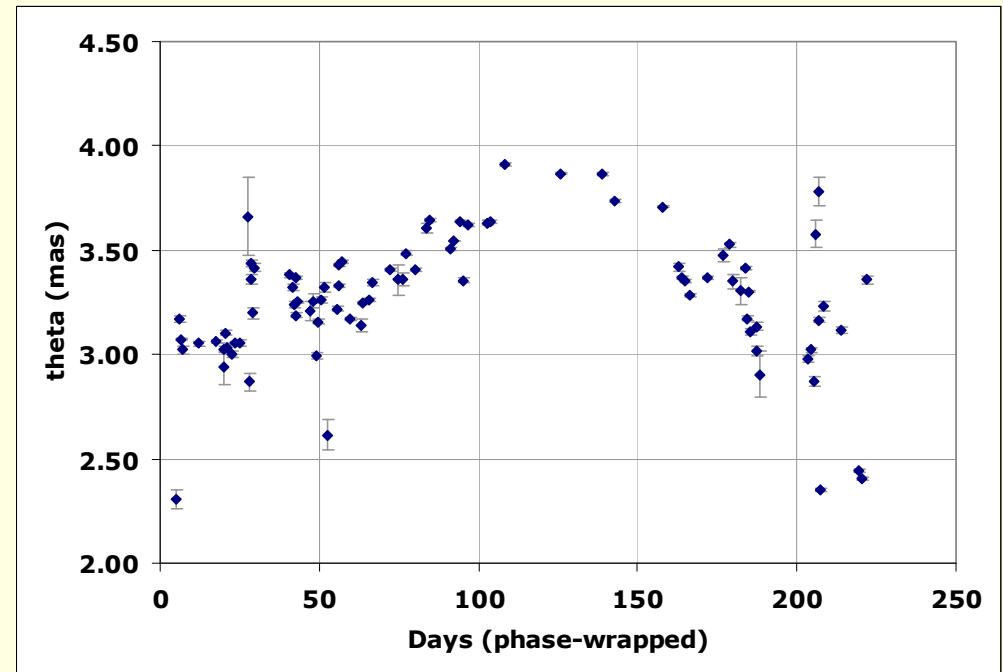

# Example Mira Variable: R Boo

- Period = 223d
- SpType = M4e-M8e
- Observed 88 nights over 8 years (!)
- Follows up on findings of Thompson+ (2002a,b) and van Belle+ (1996, 1997, 2002)

# Example Mira Variable: R Boo

- Period = 223d
- SpType = M4e-M8e
- Observed 88 nights over 8 years (!)
- Follows up on findings of Thompson+ (2002a,b) and van Belle+ (1996, 1997, 2002)

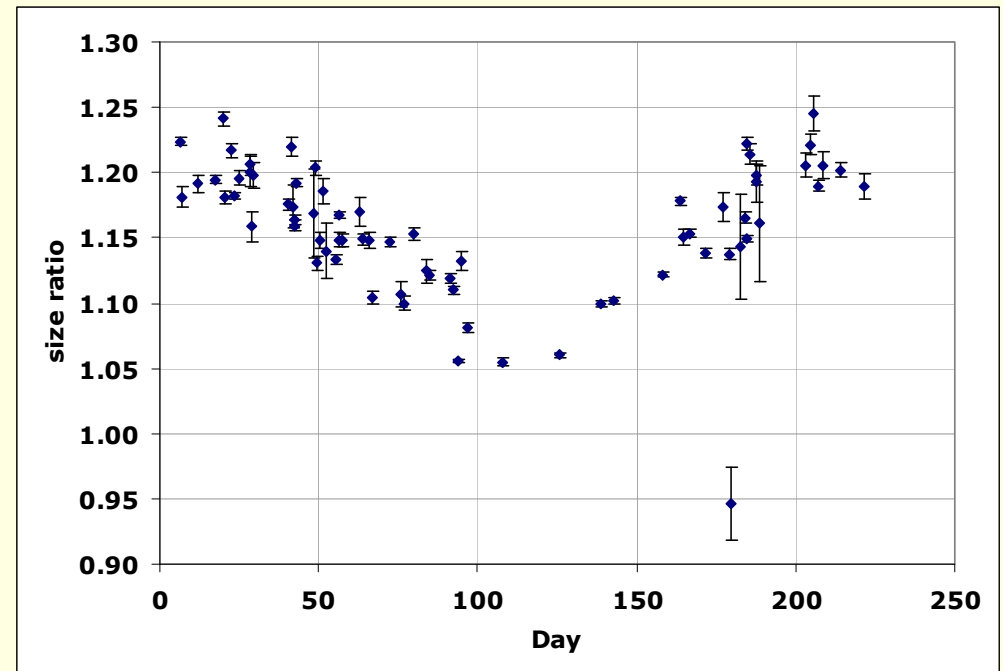

# Example Mira Variable: R Boo

- Period = 223d
- SpType = M4e-M8e
- Observed 88 nights over 8 years (!)
- Follows up on findings of Thompson+ (2002a,b) and van Belle+ (1996, 1997, 2002)

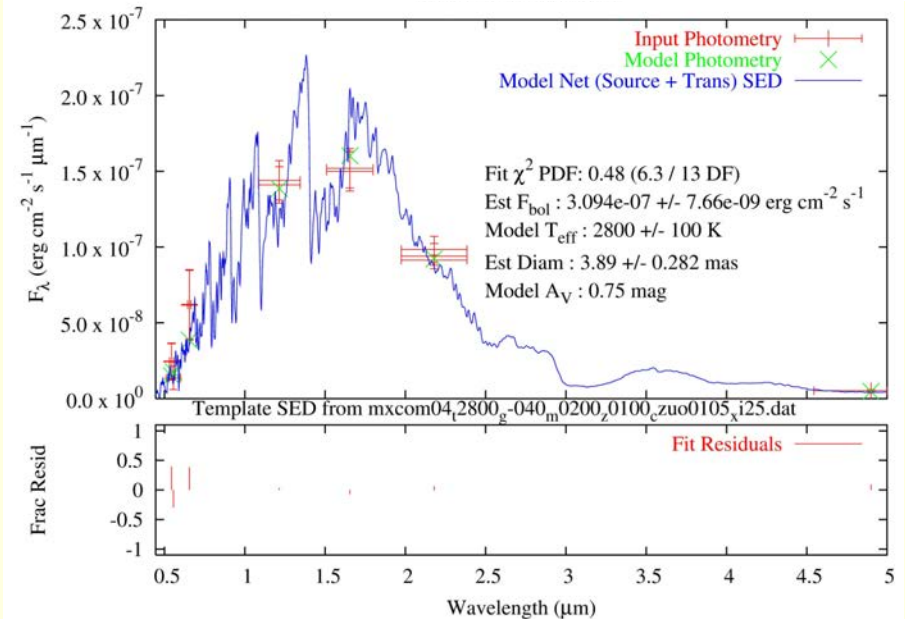

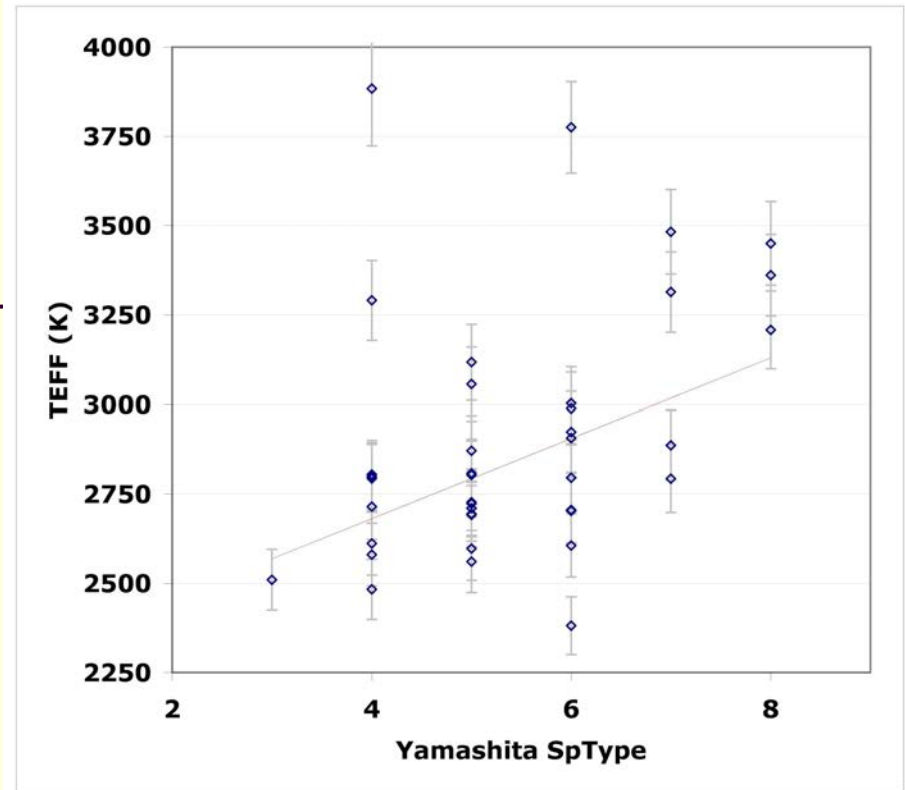

# Example Mira Variable: R Boo

- Period = 223d
- SpType = M4e-M8e
- Observed 88 nights over 8 years (!)
- Follows up on findings of Thompson+ (2002a,b) and van Belle+ (1996, 1997, 2002)

# PTI Carbon Stars

- 41 stars with diameters
  - $T_{\text{EFF}}$  determination
  - $R$  difficult, distances poor
- Roughly a dozen with multiple baselines
  - Sufficient  $\{u,v\}$  for 'shapes'
- Are all carbon stars 'non-spherical'?
  - Hot spots
  - Rotationally oblate

# PTI Carbon Stars
